

**Perdix perdix**

**SPEC 3 (1994: 3) Status Vulnerable**

Criteria See IUCN below

**European IUCN Red List Category** VU

**Global IUCN Red List Category** —

*Perdix perdix* is a widespread resident across much of Europe, which accounts for less than half of its global breeding range. Its European breeding population is very large (>1,600,000 pairs), but underwent a large decline between 1970–1990. Although the species was stable or increased in many eastern European countries during 1990–2000, declines continued in south-eastern Europe during 1990–2000, especially in central and eastern Europe. Although the species increased in northern and central Europe during 1990–2000, declines continued in south-eastern Europe during 1990–2000.

**Coturnix coturnix**

**SPEC 3 (1994: 3) Status (Depleted)**

Criteria Large historical decline

**European IUCN Red List Category** —

**Global IUCN Red List Category** —

*Coturnix coturnix* is a widespread summer visitor to much of Europe, which accounts for less than a quarter of its global breeding range. Its European breeding population is very large (>2,800,000 pairs) and fluctuates, but underwent a large decline during 1970–1990, especially in central and eastern Europe. Although the species increased in northern and central Europe during 1990–2000, declines continued in south-eastern Europe, and the total population size probably remains below the level that preceded its decline. Consequently, it is provisionally evaluated as Depleted.
