Strix uralensis is a widespread resident across much of northern and parts of central Europe, which accounts for less than a quarter of its global range. Its European breeding population is relatively small (<140,000 pairs), but was stable between 1970–1990. The species remained stable overall during 1990–2000, with no significant change in the stronghold population in Russia, and stable or increasing trends elsewhere within its European range. Consequently, it is provisionally evaluated as Secure.
