*Eudromias morinellus* is a summer visitor to northern Europe, but occurs more patchily farther south, with Europe accounting for less than half of its global breeding range. Its European breeding population is relatively small (<42,000 pairs), but was stable between 1970–1990. Although there were declines in Finland and the United Kingdom during 1990–2000, key populations in Norway and Sweden were stable (though the trend in Russia was unknown), and the species probably declined only slightly overall. Consequently, it is provisionally evaluated as Secure.

Country	Breeding pop. size (pairs)	Year(s)	Trend	Mag.%	References
