Larus ridibundus is a widespread breeder across much of Europe, which is now thought to hold >50% of its global breeding population. Its European breeding population is very large (>1,500,000 pairs), and increased substantially between 1970–1990. Although the species declined in north-central Europe—particularly in countries bordering the Baltic Sea—during 1990–2000, and underwent a moderate decline (>10%) overall, this decline is probably outweighed by the earlier increase. Consequently, the species is provisionally evaluated as Secure.
