Global IUCN Red List Category —

Criteria —

Hieraetus pennatus is a widespread summer visitor to much of south-west and eastern Europe, which accounts for less than half of its global breeding range. Its European breeding population is small (as few as 4,400 pairs), but was stable between 1970–1990. Trend data were not available for the key Spanish population during 1990–2000, but despite declines in much of south-east Europe, the species probably remained stable overall. Nevertheless, its population size still renders it susceptible to the risks affecting small populations, and consequently it is provisionally evaluated as Rare.
