Marmaronetta angustirostris breeds locally in southern Europe, which accounts for less than a quarter of its global breeding range. Its European breeding population is very small (as few as 390 pairs), and underwent a large decline between 1970–1990. Although most populations were stable or increased during 1990–2000, the large Turkish population declined, and the species probably underwent a moderate decline (>10%) overall. As a consequence of this decline and its very small population, this globally threatened species is provisionally evaluated as Vulnerable in Europe.
