Netta rufina is a widespread but patchily distributed breeder in west-central and southern Europe, which accounts for less than half of its global breeding range. Its European breeding population is relatively small (<59,000 pairs), and declined markedly between 1970–1990. Although the species declined in a few countries during 1990–2000, many populations (including the Russian stronghold) increased or were stable, and it underwent a moderate increase overall. This increase probably outweighs the earlier decline, and consequently the species is provisionally evaluated as Secure.
