Criteria —

Turdus iliacus is a widespread breeder in northern Europe, but winters across much of the continent, which constitutes >50% of its global wintering range. Insufficient information was available to assess the species's status using wintering population data, but its European breeding population is extremely large (>16,000,000 pairs), and was stable between 1970–1990. Breeding populations in most countries (including Russia) were stable or increased during 1990–2000, and the species probably remained stable overall. Consequently, it is provisionally evaluated as Secure.

Country	Breeding pop. size (pairs)	Year(s)	Trend	Mag. %	References
Belarus	70,000 – 140,000	97–02	0	0–19
