**Regulus ignicapilla**

**FIRECREST**

**SPEC 3 (1994: 3) Status** Depleted

**European IUCN Red List Category** — Criteria —

**Global IUCN Red List Category** — Criteria —

**Regulus ignicapilla** is a widespread breeder in west-central and southern Europe, which constitutes >75% of its breeding range. Its European breeding population is very large (>3,300,000 pairs), and was stable between 1970–1990. Although the trend of the key population in Spain during 1990–2000 was unknown, most other populations—including those in Germany, Italy and Romania—were stable, and the species probably remained stable overall. Consequently, it is provisionally evaluated as Secure.

**Muscicapa striata**

**SPOTTED FLYCATCHER**

**SPEC 3 (1994: 3) Status** Depleted

**European IUCN Red List Category** — Criteria Moderate historical decline

**Global IUCN Red List Category** — Criteria —

**Muscicapa striata** is a widespread summer visitor to Europe, which accounts for less than half of its global breeding range. Its European breeding population is extremely large (>14,000,000 pairs), but underwent a moderate decline between 1970–1990. Although there were declines in a small number of countries during 1990–2000, the species was stable or increased across most of its European range, and declined only slightly overall. Nevertheless, its population has clearly not yet recovered to the level that preceded its initial decline. Consequently, it is evaluated as Depleted.
