Sturnus roseus is a widespread summer visitor to south-eastern Europe, which accounts for less than half of its global breeding range. Its European breeding population is relatively small (<210,000 pairs), and was broadly stable between 1970–1990. Although most European populations experienced sizeable fluctuations during 1990–2000, the species remained broadly stable overall, and consequently is evaluated as Secure.

Country	Breeding pop. size (pairs)	Year(s)	Trend	Mag.%	References
