Criteria —

Anthus berthelotii is endemic to Europe, where its entire global range is confined to the Canary Islands and Madeira. Its breeding population is relatively small (probably <100,000 pairs), although recent data on the size of the Madeira population were not available. Populations on both island groups were stable between 1970–1990, and although their trends during 1990–2000 were not known, there was no evidence to suggest that the species declined. Consequently, it is provisionally evaluated as Secure.

Country	Breeding pop. size (pairs)	Year(s)	Trend	Mag.%	References
Portugal					
Madeira	Present	02	?	-	
Spain					
Canary Is.	(20,000 – 100,000)	97-03	?	-	28,25
Total (approx.)	20,000 – 100,000		Overall trend	Unknown	
Breeding range	>20,000 km²		Gen. length	<3.3 %	Global pop. 100
