Corvus frugilegus is a widespread resident across much of Europe, which accounts for less than half of its global range. Its European breeding population is extremely large (>10,000,000 pairs), and increased between 1970–1990. Although the species declined in a few countries during 1990–2000, most European populations were stable or increased. The trend of the key population in Russia was unknown, but the species was probably stable overall. Consequently, it is provisionally evaluated as Secure.
