Certhia brachydactyla is a widespread resident across much of central and southern Europe, which constitutes >75% of its global range. Its European breeding population is very large (>2,700,000 pairs), and was stable between 1970–1990. Although the trend of the Spanish population during 1990–2000 was unknown, the other key population—in France—increased, and trends were stable or increasing across most of the rest of its European range. Consequently, the species is provisionally evaluated as Secure.
