Locustella naevia is a fairly widespread summer visitor to much of Europe, which constitutes >50% of its global breeding range. Its European breeding population is large (>840,000 pairs), and was stable between 1970–1990. Although there were declines in a number of countries during 1990–2000, the sizeable population in Poland was stable, and the species increased or was stable elsewhere. The trend of the stronghold population in Russia was unknown, but the species probably remained stable overall, and consequently it is provisionally evaluated as Secure.
