Acrocephalus melanopogon is a widespread but patchily distributed breeder in southern and eastern Europe, which accounts for less than half of its global breeding range. Its European breeding population is large (>150,000 pairs), and was stable between 1970–1990. Although the trend in its Russian stronghold during 1990–2000 was unknown, populations were stable across most of the rest of its European range—including the sizeable one in Romania—and the species remained stable overall. Consequently, it is provisionally evaluated as Secure.
