Anthus gustavi has a predominantly Siberian breeding distribution, which extends just west of the Urals into northern European Russia. Its European breeding population is small (as few as 1,000 pairs), but was stable between 1970–1990. Trend data were not available during 1990–2000, but there was no evidence to suggest that the species declined. Although the size of the European population could make it susceptible to the risks affecting small populations, it is marginal to a much larger non-European population. Consequently, it is provisionally evaluated as Secure.

Country	Breeding pop. size (pairs)	Year(s)	Trend	Mag. %	References
