Total (approx.)	1,500 – 2,500	Overall trend Unknown			
Breeding range	>50,000 km ²	Gen. length. <3.3 % Global pop. 5–24			

Prunella atrogularis is a patchily distributed summer visitor to north-east European Russia, which accounts for less than a quarter of its global breeding range. Its European breeding population is small (as few as 1,500 pairs), but its trend during 1970–1990 was unknown. Trend data were also unavailable for 1990–2000, although there is no evidence to suggest that the species is declining. Nevertheless, its population size still renders it susceptible to the risks affecting small populations, and consequently it is provisionally evaluated as Rare.
